DETAILED ACTION

Response to Amendment

This Office Action is responsive to the Amendment filed February 28, 2006. The rejection of claims 23-25 under 35 U.S.C. § 102(e) as being anticipated by Isoyama et al., U.S. Patent 6,093,503 is overcome. However, the pending claims are rejected as follows:

- Claims 23-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Isoyama et al., U.S. Patent 6,093,503.
- Claims 26- 28 under 35 U.S.C. § 103(a) as being unpatentable over
 Isoyama et al., U.S. Patent 6,093,503 in view of Miyasaka U.S.
 Patent 5,869,208.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 23-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Isoyama et al., U.S. Patent 6,093,503.

Art Unit: 1746

With respect to claims 23, Isoyama teaches a method of making a positive electrode active material comprising: mixing a first ingredient of Ketjen Black and 90% by weight of lithium manganese oxide (Example 22); press molding the mixture (col. 12, lines 5-10); sintering the mixture in a temperature range from 300 to 1200°C embracing Applicant's range not lower than 600°C and not higher than 850°C (col. 7, lines 57-68); wherein the positive electrode is a lithium composite manganese oxide comprising an aggregate (col.2, lines 12-20) of primary particles having a grain diameter of 1 to 20 microns and the negative electrode is a metallic lithium (col. 2, lines 12-20). Further concerning claim 23, the lithium composite oxide is LiMn₂O₄ meeting the general formula Li_xMn_{2-y}M_yO₄ where x=1 and y=0. With respect to claims 24 & 25, the spinel LiMn₂O₄ (col. 6, lines 25-30) has a primary particle size of 1 to 20 microns, embracing a primary particle diameter of 0.5 to 3 microns. Specific particle sizes of about 1 to 3 microns are exemplified in column 29, lines 24-50. With respect to claim 31, the negative electrode is metallic lithium (col. 2, lines 30-40). With respect to claim 33, the electrolyte salts include LiClO₄, LiBF₆, LiPF₆, LiCF₃SO₃ and LiAsF₆ (col. 5, lines 40-45). Regarding claim 34, the electrolyte is dissolved in an organic solvent selected from propylene carbonate, diethyl carbonate and gamma-butyrolactone (col. 5, lines 41-46).

Isoyama does not expressly disclose: specific surface area measured by the BET method being between 0.2 m²/g and 2 m²/g; the sequential steps of

Art Unit: 1746

molding the mixture prior to sintering; and the negative electrode reversibly doping and dedoping lithium.

However, it would have been obvious to one of ordinary skill in the art at the time the instant invention was made mold the cathodic material prior to sintering, because selection of any order of performing process steps is prima facie obvious. In re Gibson, 39 F.2d 975, 5USPQ 230 (CCPA 1930).

The limitation in claim 23, with respect to the specific surface area measured by BET between 0.2m²/g and 2m²/g, is necessarily present in the cathode material set forth in the prior art, because Isoyama employees the same lithium manganese oxide material with the same primary particle size as set forth by Applicant. The limitation in claim 23, with respect to the negative electrode material reversibly doping and dedoping lithium is necessarily present in the negative electrode as set forth in the prior art, because Isoyama employs the same lithium anodic material set forth by Applicant. In accordance with MPEP 2144.04, "products of identical chemical composition can not have mutually exclusive properties." A chemical composition and its properties are inseparable. Therefore, if the prior art teaches the identical chemical structure, the properties applicant discloses and/or claims are necessarily present. In re Spada, 911 F.2d 705, 709, 15 USPQ 2d 1655, 1658.

Art Unit: 1746

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 26-28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Isoyama et al., U.S. Patent 6,093,503 in view of Miyasaka U.S. Patent 5,869,208.

Isoyama teaches a method of making a positive active material as described in the 35 U.S.C. § 102(e) rejection hereinabove. The method includes creating a slurry by kneading an admixture of graphite and polyvinylidene fluoride (col. 5, lines 35 & col. 39, lines 10-20) with LiMnO₂ dissolved in a liquid phase (col. 39, lines 5-20). The lithium oxide, conductive agent and binder are mixed in a weight ratio of 9: 0.6 to 0.4 (col. 39, lines 10-20). With respect to claim 28, cathode material is applied to an aluminum foil current collector (col. 39, lines 10-15) with a thickness of 0.02 to 200 microns.

Isoyama is silent to created a slurry of active material, binder and conductive again (claims 27 & 32), employing 86% lithium composite

Art Unit: 1746

manganese oxide (claim 276) and 10% graphite (claims 27 & 32). The reference is also silent to pulverizing the sintered mixture (claim 26).

Miyasaka teaches that it is conventional to create a slurry of electrode material prior to coating on a current collector (col. 123, lines 5-15). The electrode material includes lithium manganese oxide, a binder and conductive agent (col. 12, lines 5-`5). The reference also teaches pulverizing to increase the specific surface area of the active material (col. 11, lines 20-30).

It would have been obvious to one having ordinary skill in the art at the time the instant invention was made to employ the slurry preparation of Miyasaka in the method of Isoyama, in order to facilitate coating electrode material on the current collector. The skilled artisan recognizes that a slurry would increase malleability of the active material thereby improving coating ability of said material on the current collector (claim 27).

With respect to pulverizing the sintered electrode material (claim 26), the invention as a whole would have been obvious to one having ordinary skill in the art at the time the invention was made, because even though Isoyama is silent to pulverizing the active material, Miyasaka teaches that pulverization increases the specific surface area of the active material (col. 11, lines 20-30).

With respect to the amount of lithium manganese oxide, it would have been obvious to one of ordinary skill in the art at the time the time the invention was made to employ 86% by weight lithium manganese oxide since it has been held that discovering optimum value of a result effective variable

Art Unit: 1746

involves only routine skill in the art. In re Boesch, 617 F 2d 2727, 205 USPQ 215 (CCPA 1980). The skilled artisan recognizes that the amount of active material directly effects the amount of voltage and current produced by the cell.

With respect to the amount of graphite, it would have been obvious to one of ordinary skill in the art at the time the invention was made to employ 10% by weight of graphite since it has been held that discovering optimum value of a result effective variable involves only routine skill in the art. In re Boesch, 617 F. 2d 272, 205 USPQ 215 (CCPA 1980). The skilled artisan recognizes that the amount of conductive agent directly effects conductivity of the electrode.

Response to Arguments

Applicant asserts that Isoyama is not anticipatory because the reference teachers using a different sequence of steps and thus, arrives at a different result. Specifically, Isoyama teaches mixing the previously sintered cathodic material before press molding. In contrast, Applicant's claimed invention molds a mixture of a lithium composite oxide and then sinters. This argument is not persuasive. In accordance with MPEP 2144.04, selection of any order of performing process steps is prima facie obvious. See Ex parte Rubin , 128 USPQ 440 (Bd. App. 1959). Therefore, it would be obvious to reverse the molding/sintering order in preparation of a positive electrode

Art Unit: 1746

material. In order to overcome this rejection, it is suggested that a declaration is filed that compares the closest prior art. Specifically, a declaration proving that Isoyama does not produce a cathode with a specific surface area within the desired range is required. The declaration filed April 12, 2004, asserts unexpected results, but fails to illustrate that prior art produces specific surface areas outside the instant range. Therefore, the claims are newly rejected under 35 USC 103(a) in view of Isoyama.

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In

Art Unit: 1746

no event, however, will the statutory period for reply expire later than SIX

MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications

from the Examiner should be directed to Monique Wills whose telephone

number is (571) 272-1309. The Examiner can normally be reached on

Monday-Friday from 8:30am to 5:00 pm.

If attempts to reach Examiner by telephone are unsuccessful, the

Examiner's supervisor, Michael Barr, may be reached at 571-272-1414. The

fax phone number for the organization where this application or proceeding is

assigned is 703-872-9306.

Information regarding the status of an application may be obtained from

the Patent Application Information Retrieval (PAIR) system. Status information

for published applications may be obtained from either Private PAIR or Public

PAIR.

Status information for unpublished applications is available through

Private PAIR only. For more information about the PAIR system, see
